

## Automatic Revolving Doors

Human nature is often conditioned more by emotional than rational impacts; indeed appearance is an extremely effective influencing force. Building, through its own language conveyed by attractive architectural designs, is not immune from this involvement and is capable of offering subtle messages. When we look at building we immediately perceive its importance through its imposingness, design and the beauty of its façade. Then we analyze the details, such as the entrances, windows and friezes and we are able to express an initial judgement. These elements are not banal aesthetic messages, but highlight the precise thought of that which the property wishes to convey us in terms of the quality, importance and certainties of those who occupy it. In proposing its new **EXEO** range of revolving doors, we once again wishes to make a winning opportunity available to those who desire to convey messages of exclusive prestige and complete aesthetic qualification.

### **EXEO**

#### **Automatic Revolving Pedestrian doors**

The **EXEO** doors not only satisfy aesthetic privileges, but above all retain the heat during winter, coolness during the summer, and provide a barrier against annoying outside noise, draught, winds and dust. All of these reasons explain why the most prestigious hotels, the most famous banks, the most elegant shopping centres and the most authoritative offices have always adopted such entrance systems: the overall benefit obtained, without forgetting the important energy saving, is so much higher than the initial investment.

**EXEO** consists of a range of doors with a circular structure and internal revolving leaves, which can be supplied in a manual or an automatic version. In the manual version the door leaves are moved by pushing, while in the automatic version, the movement is transmitted by a geared motor located in the upper part of the structure, in line with the supporting rod of the mobile door leaves.

**EXEO** is available in a wide range of diameters, with three or four door leaves, in both the manual and automatic versions. The door diameters available for both versions are: 1800mm - 2000mm - 2200mm - 2400mm - 2600mm - 2800mm - 3000mm (larger dimensions upon request). The height of the passage space is fixed and is 2200mm for all the models. All the models are supplied with anodized aluminium or RAL coloured finish.
