

## Underground Automatic Systems for Swing Gates

Valuable gates very often require "invisible" automatic systems to avoid altering their aesthetic appearance. The range of underground systems has been designed with such needs in mind and is ideal for insertion under existing paving, especially when this is of high artistic value, due to its compact dimensions and the flexibility of the two solutions available.

### Cubic 110° - Cubic 180°

**Underground automatic system for existing swing gate with opening angle of 110° or 180°**

The **DU.IT14N/DU.350N** underground-gearred motors are "invisibly" housed beneath the gate leaf, along the axis of the hinge, and are designed to move all types of leaves, even heavy or large ones. As they are non-reversible they require a release system, **which may be installed on the gate leaf or at a distance**, through a special key-handle release. Versions are available that use a 230V AC power supply, for **frequent use** or a 230V power supply with a 24V DC to the motor and auxiliary circuits through a control panel, for **intensive use**. All versions come with battery back-up; also with an optional control of gates via a remote control system; and other options.
